

Step 7: Running Revizor

The application is for now running by means of `tmux`.

Change to the directory of the instance you want to run:

```
production: /data/web/ocrui/backend
```

```
development: /data/web/ocrui/backend-dev
```

... and run (choose `prod` or `dev` as name):

```
tmux new-session -t ocrui-{prod|dev} ./run.sh
```

You can list sessions with:

```
tmux list-sessions
```

... and attach them with:

```
tmux attach -t ocrui-{prod|dev}
```

TODO: write a real startup script!

NOTE! tmux is needed! Otherwise ocr-editor is not able to download the files to be edited.

NOTE! Starte both prod and dev sessions !

NOTE! Run tmux as vanhemel !
